X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)

scaler = StandardScaler()

X_train_scaled = scaler.fit_transform(X_train)

X_test_scaled = scaler.transform(X_test)

```
```

Building Your First Neural Network with Keras

Keras provides an intuitive API to build and train neural networks.

Example:

```
```python

from tensorflow.keras.models import Sequential

```

```
model = Sequential()

model.add(Dense(64, activation='relu', input_shape=(X_train.shape[1],)))

model.add(Dense(32, activation='relu'))

model.add(Dense(1, activation='sigmoid'))

model.compile(loss='binary_crossentropy', optimizer='adam', metrics=['accuracy'])

model.fit(X_train_scaled, y_train, epochs=50, batch_size=32, validation_split=0.2)

'''
```

## Understanding and Tuning Hyperparameters

Key hyperparameters include:

model.add(MaxPooling2D(pool_size=(2,2)))

model.add(Flatten())

model.add(Dense(128, activation='relu'))

model.add(Dense(num_classes, activation='softmax'))

...
```

Recurrent Neural Networks (RNNs) and LSTMs

Used in sequence data like text or time series.

Example:

```
```python

from tensorflow.keras.layers import LSTM

model = Sequential()

model.add(LSTM(100, input_shape=(timesteps, features)))

model.add(Dense(1))

...
```

## Autoencoders and Generative Models

Autoencoders are used for dimensionality reduction and anomaly detection.

## Training, Evaluation, and Deployment

Once models are built, focus on training strategies, evaluation metrics, and deploying models.

### Model Training and Validation

- Use early stopping to prevent overfitting

- Adjust hyperparameters based on performance

Sample callback:

```
```python
from tensorflow.keras.callbacks import EarlyStopping

early_stop = EarlyStopping(monitor='val_loss', patience=5)

model.fit(X_train_scaled, y_train, epochs=100, validation_split=0.2, callbacks=[early_stop])
```
```

## Model Evaluation Metrics

Depending on the task, metrics include:

- Accuracy
- Precision, Recall, F1-score
- ROC-AUC
- Mean Squared Error (regression)

## Deploying Deep Learning Models with Python

Frameworks like TensorFlow Serving, Flask, or FastAPI facilitate deployment.

```
```python
from flask import Flask, request, jsonify

import tensorflow as tf

app = Flask(__name__)

model = tf.keras.models.load_model('my_model.h5')
```

```
@app.route('/predict', methods=['POST'])

def predict():

    data = request.get_json(force=True)

    input_data = preprocess(data['input'])
